

AVIATIONTOYS.NL GRUNAU BABY KIT.

Grunau Baby tail building instructions.

All parts for the elevator, fin and rudder can be found in balsa sheet 8.

the construction of the elevator and rudder is very simple; Just follow the pictures. Take care in sanding the airfoils and make sure the trailing edges are app. 1.5mm thick. Thinner will result in warps after covering.

Another thing to take notice from is the position of the horns. In the fuselage you have glued in the tubes for the steering lines, left and right have different positions.

The lowest slot is for the rudder, the higher one for the stabiliser. So make sure the horn in the stabiliser is at the correct side, after sanding the airfoil this matters!

Elevator and fin are glued into place on the fuselage. The hinge lines are made from strips covering material on both sides.
